2.3 Reading data from SAP IBP for Demand	4
2.4 Transformation	5
2.5 Writing into SAP Analytic Cloud	5
2.6 Properties of the Integration Flow	5
3 Configuration steps on Cloud Integration	6
3.1 Configure Receiver Adapter	6

# 1 Prerequisites

The package Commercial Planning contains SAP Analytics Cloud models for Sales and Marketing Planning, as well as corresponding SAP Integration Suite Integration Flows. These Integration Flows read (baseline quantity) data from SAP Integrated Business Planning (IBP) and read prices from SAP S/4HANA to write them into SAP Analytics Cloud. There are also Integration Flows to write the (planned drivers) data back from SAP Analytics Cloud to SAP IBP for demand.

The Integration Flow “Send IBP for Demand amounts to Analytics Cloud Marketing model” connects the content package model for Marketing Planning in SAP Analytic Cloud with SAP IBP for Demand. This flow sends the (baseline quantity) data from SAP IBP into SAC.

This Integration Flow is a possible implementation approach. But it is necessary to check the individual business needs.

## 2 Documentation

The Integration Flow reads fact data from IBP for demand, transforms the data and writes the data into SAP Analytics Cloud, into the marketing planning model of the content package Commercial Planning. To minimize the memory footprint, a semantical partitioning on the timestamp is used. So, data is read month by month, transformed month by month and written into SAP Analytics cloud month by month. As the data is aggregated, it is relevant to have all AMOUNT values for each property combination send to IBP in one loop.

### 2.1 Starting the flow

The iFlow is stated via API call. Externalized Parameter <SAPHDA\_API\_ENDPOINT>

The payload that is expected to be sent with this call contains the SAP Analytics Cloud model ID, a date from when data is read as well as the time horizon that should be exported (calmonthFrom and calmonthTo are included int the boundaries).

An example payload looks like:

```
{
  "modelID": "C9fcb403perika utboo52ik5u47",
  "calmonthFrom": "202301",
  "calmonthTo": "202401"
}
```

### 2.2 Reading Master Data

The Integration FLOW utilizes the following master data

- Customer <-> Marketingorganisation Mapping. This mapping must be stored in the Groovy script method CustomerSalesOrg of script saphda\_logic.groovy.
- Salesorganisation <-> Company Code. This mapping is read from the S/4HANA API api\_salesorganization\_srv/A\_SalesOrganization
- The timestamps for the semantical partitioning are read from IBP API.

### 2.3 Reading data from SAP IBP for Demand

Fact data is read from SAP Analytic Cloud via oData API with the query filter stored in property saphda\_queryParameters\_calculated.

By delivery the select is to be configured to

- PRDID Product
- CUSTID Customer
- LOCID Location
- BASEFCSTQTY Quantity
- PERIODID3\_TSTAMP Timestamp/Month

The filter is set to

- UOMTOD = EA
- PERIODID3\_TSTAMP = is filled automatically

## 2.4 Transformation

The transformation is processed in the method transform of groovy script saphda\_logic.groovy. The transformation derives the Analytics Cloud fact data payload from the SAP IBP for demand response.

- IBP on Demand is based on ISO 8601-1:2019 extended timestamp format (YYYY-MM-DDTHH:MM:SS), SAP Analytics Cloud model is based on Calendar Weeks (YYYYMM), so this mapping is done in the method
- The SAP Analytics Cloud dimensions members for SAP\_ALL\_COMPANY\_CODE and SAP\_ALL\_SALESORGANISATION are derived from CUSTID
- As the marketing model is not based on Customer, all data is aggregated on Customer

## 2.5 Writing into SAP Analytic Cloud

Data is written into SAC in chunks (by default month by month). These data chunks are written into SAC via a Job, which is opened with the first package and closed with the last. With the last data package, the job is validated, and data is committed. Please refer to the documentation of the SAP Analytic Cloud API for further information.

## 2.6 Properties of the Integration Flow

All custom properties used in this Integration Flow are declared in the content modifier “initialize saphda properties”. But the property saphda\_queryParameters needs to be refreshed in each loop, which happens in the content modifier “Refresh saphda properties”. So, the odata filter for IBP needs to be customized identically in these two content modifiers.

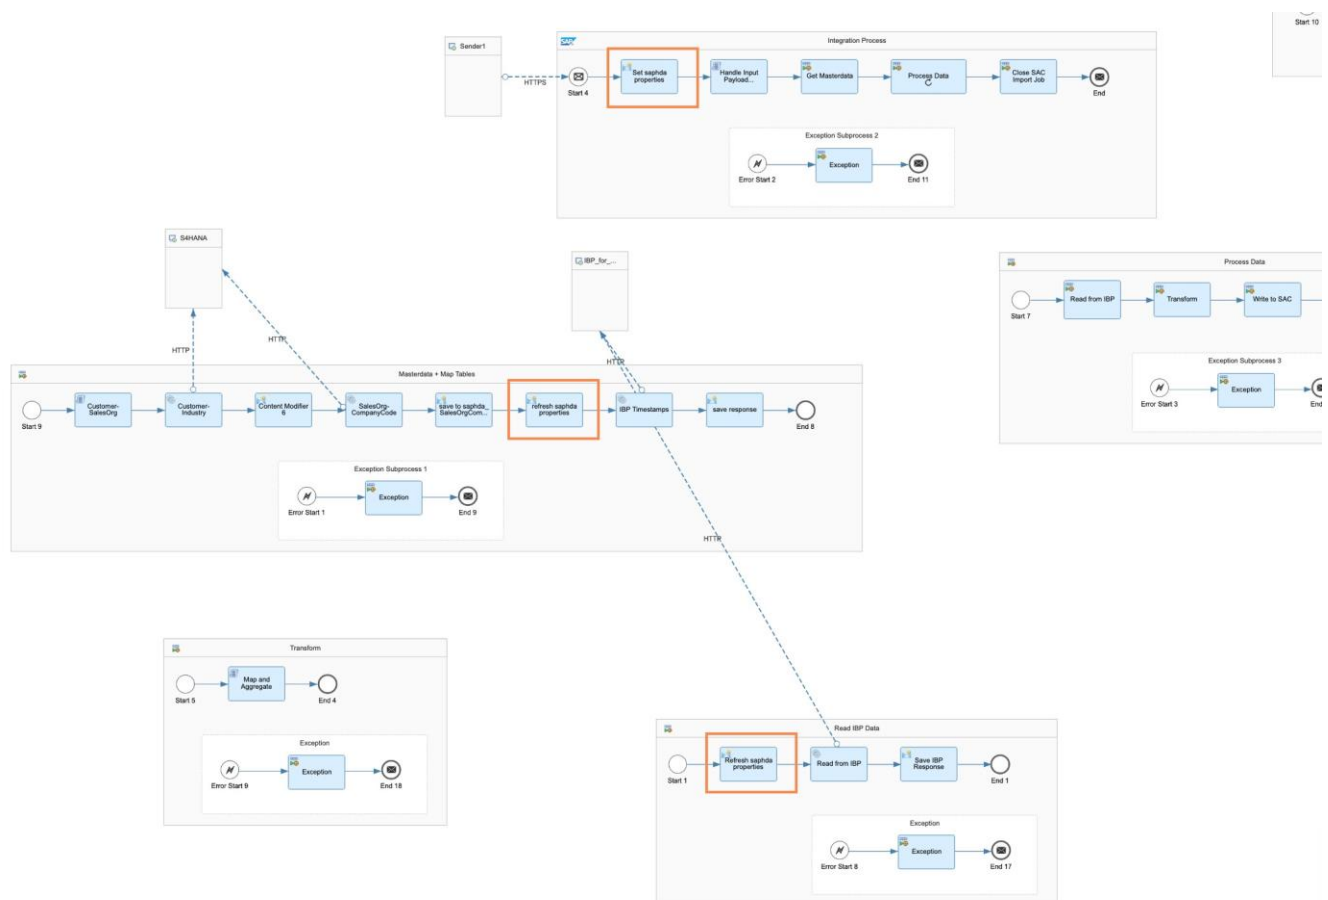

Figure 1 red highlighted are custom properties to be configured

## 3 Configuration steps on Cloud Integration

### 3.1 Configure Receiver Adapter

Receivers are connecting SAP Analytics Cloud, SAP IBP for Demand, SAP S/4HANA. If the flow should be used without adjustments, it is necessary to have the Content Packages Commercial Planning for SAP Analytics Cloud installed, as well as IBP... SP/Version. In all systems user and authorizations need to be granted. For using the master data mapping as they are built by delivery, also a S/4HANA system, user and access needs to be available. Please refer to the relevant documentation.

The following configuration is necessary

- Credential Artifacts
  - o SAP Analytics Cloud with the credentials of an App Integration OAuth authorization.  
Externalized Parameter <SAPHDA\_SAC\_CREDENTIAL>
  - o IBP for Demand with IBP External Planning Data Integration Communication Szenario SAP\_COM\_0720.  
Externalized Parameter <SAPHDA\_IBP\_CREDENTIAL>
  - o S/4HANA  
Externalized Parameter <SAPHDA\_S4\_CREDENTIAL>
- URLs for the two Systems
  - o SAP Analytics Cloud  
Externalized Parameter <SAPHDA\_SAC\_URL>
  - o IBP for Demand  
Externalized Parameter <SAPHDA\_IBP\_URL>
  - o S/4HANA  
Externalized Parameter <SAPHDA\_S4\_URL>
