3.7.1.	Prerequisites	17
3.7.2.	Communication User	17
3.7.3.	Communication System	18
3.7.4.	Communication Arrangement	21

1 Prerequisites

The Iflow consists in sending an Equipment from SAP ERP (SAP ECC) to S4HANA Cloud.

- Configuration steps in SAP ERP (SAP ECC):
 - o Setting up of IDoc Communication for create and update scenario which includes:
 - Define Logical Systems, Assign Logical Systems, Create the RFC Destination, Create Port for IDOC Processing, Maintain ALE Distribution Model, Manually Maintain Partner Profile.
- Configuration steps in SAP S4HANA Cloud:
 - o Configuration of Communication Arrangement for Scenario ID SAP_COM_0395 Related OData connection details for create and update scenario which includes:
 - Address, Proxy Type and Authorization.

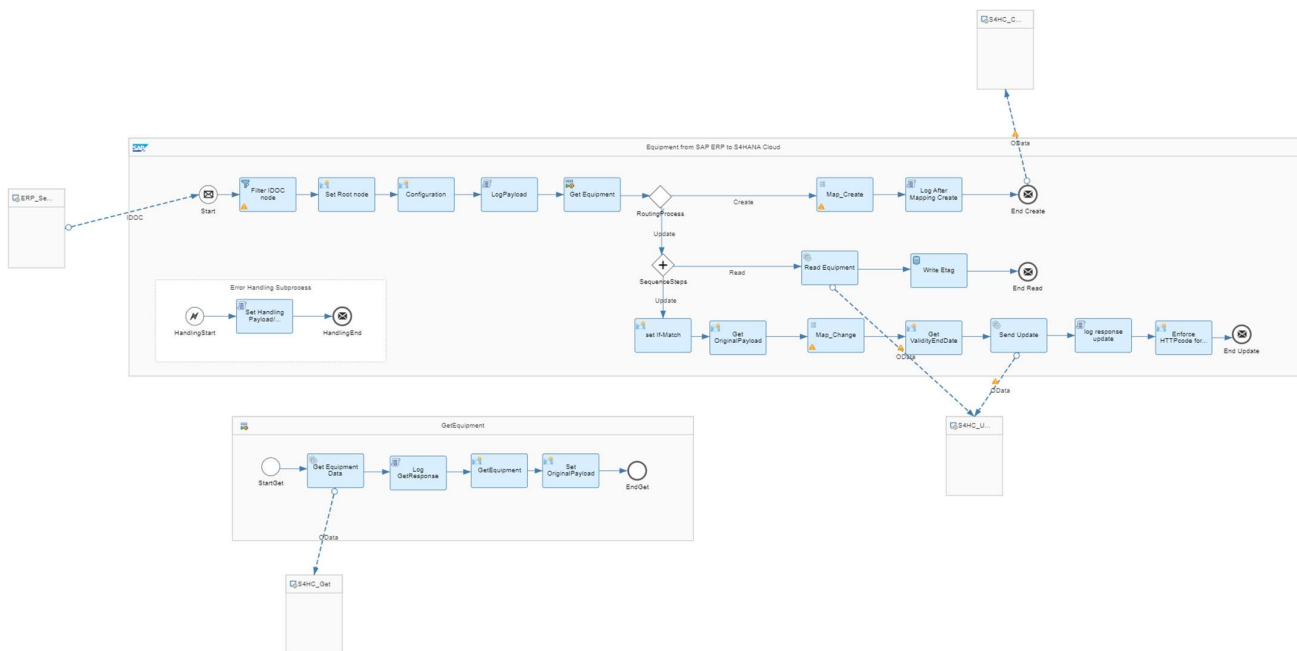

2 Documentation

Regardless of whether the Equipment IDoc defined in SAP ERP is EQUIPMENT_CHANGE02 or EQUIPMENT_CREATE02, the flow will filter by the main IDoc node to process all messages as if they were one.

What will define if the equipment is a creation or a change is a call to the API OData with the equipment number to check if the equipment exists in S/4HANA, if it exists, it follows the change route, if not the creation route.

During the Change Equipment part, it is necessary read the Equipment via OData API to get the eTag value and send during the Patch OData call in sequence. It is also relevant to know that the last content modifier in the change process it was required because the IDoc in SAP ERP does not accept another HTTP Status code unless 200, as the Patch Operation success respond with 207 status code so the IDoc status will get an error in SAP ERP side.

Equipment Creation or Change in S/4HANA Cloud is triggered by OData API call related to communication Scenario SAP_COM_0395 - Asset Management Master Data Integration.

3 Configuration steps on SAP Cloud Integration

To set up the IDOC

Try to define specific section, such as:

- Receiver Configuration
- Sender Configuration
- Cloud Connector Configuration
- Sender System Configuration
- Receiver System Configuration

If there are any backend system configuration needed, please describe them here shortly.

The following subsections are only proposals and can be changed.>

3.1 Configure Sender IDOC Adapter

The screenshot shows the 'IDOC' configuration page in SAP Cloud Integration. The 'General' tab is selected. The 'Name' field is 'IDOC_SND_ERP_Equipment'. The 'CHANNEL DETAILS' section includes 'Direction' (Sender), 'System' (ERP_Sender), and 'Description'. The 'ADAPTER DETAILS' section includes 'Adapter Type' (IDOC), 'Transport Protocol' (HTTPS), and 'Message Protocol' (IDoc SOAP).

Figure 1 – Sender IDOC Adapter – General/Channel Details.

The screenshot shows the 'IDOC' configuration page in SAP Cloud Integration, with the 'Connection' tab selected. The 'CONNECTION DETAILS' section includes 'Address' (/IDOC/EQUIPMENT), 'Authorization' (User Role), and 'User Role' (ESBMessaging.send) with a 'Select' button.

Figure 2 - Sender IDOC Adapter – Connection.

Address	Enter the URL of the SAP ERP system to connect to.
Authorization	Enter the authorization option. In this case, it was used “User Role” type, since this is based on roles defined on the tenant for the user associated with the inbound request.
User Role	Enter the User Role. It is a predefined role provided by SAP which authorizes a sender system to process messages on a tenant.

The screenshot shows the 'IDOC' configuration window with the 'Processing' tab selected. The 'PROCESSING DETAILS' section contains the 'Invalid XML Character Handling:' label and a dropdown menu set to 'Throw Exception'.

Figure 3 - Sender IDOC Adapter – Request Processing.

The screenshot shows the 'HTTPS' configuration window with the 'Conditions' tab selected. The 'MAXIMUM MESSAGE SIZE' section contains the 'Body Size (in MB):' label and a text input field with the value '40'.

Figure 4 - Sender IDOC Adapter – Conditions/Maximum Message Size.

For further information:

IDOC Adapter:

https://help.sap.com/docs/CLOUD_INTEGRATION/368c481cd6954bdfa5d0435479fd4eaf/6042250661aa437c81dc8b3b4de567c4.html?locale=en-US

3.2 Configure Receiver OData Adapter (GET Equipment)

The receiver OData Adapter for Get Equipment data is described below:

The screenshot shows the 'OData' configuration window with the 'General' tab selected. The 'Name' field is 'OData_RCV_GetS4HC'. Below are two sections: 'CHANNEL DETAILS' and 'ADAPTER DETAILS'. In 'CHANNEL DETAILS', 'Direction' is 'Receiver', 'System' is 'S4HC_Get', and 'Description' is empty. In 'ADAPTER DETAILS', 'Adapter Type' is 'OData', 'Transport Protocol' is 'HTTP', and 'Message Protocol' is 'OData V2'.

Figure 3 – Receiver OData Adapter (GET Equipment) – General/Channel Details.

The screenshot shows the 'OData' configuration window with the 'Connection' tab selected. The 'CONNECTION DETAILS' section includes: 'Address' (https://mysystemcode.s4hana.ondemand.com/sap/o), 'Proxy Type' (Internet), 'Authentication' (Client Certificate), 'Private Key Alias' (sap_cloudintegrationcertificate), and 'CSRF Protected' (checked).

Figure 4 - Receiver OData Adapter (GET Equipment) – Connection/Connection Details.

Address	Enter the address of the OData service. <i>Note: In this case, it is used the API:</i> <i>https://mysystem.api.s4hana.ondemand.com/sap/opu/odata/sap/API_EQUIPMENT</i>
Proxy Type	The type of proxy you want to use for establishing connection with OData Service. Currently, you can choose between Internet (default) and On-Premise. Define Internet for S/4HANA Cloud. For On-premise systems it is required to define Location ID.
Location ID (Only Proxy Type as On-Premise)	Location ID that you've configured in the cloud connector installed on your system.
Authentication	Enter the authentication method for connecting to the OData service. E.g Basic, client certificate..
Credential Name	Credential name of the credentials that is deployed in Security Material section of  (Operations View)
Private Key Alias (Only for Client Certificate Authentication).	Enter the private key alias that enables the system to fetch the private key from keystore for authentication.
CSRF Protected	Check. By default, option.

3.6 <Configure Cloud Connector>

<Describe the configuration steps on the Cloud Connector to connect to OnPremise System >

3.7 Configure Receiver system (SAP S/4HANA Cloud)

This section describes how to set up the communication scenario SAP_COM_0395 for Asset Management Master Data Integration by using the Communication Arrangement tool.

3.7.1. Prerequisites

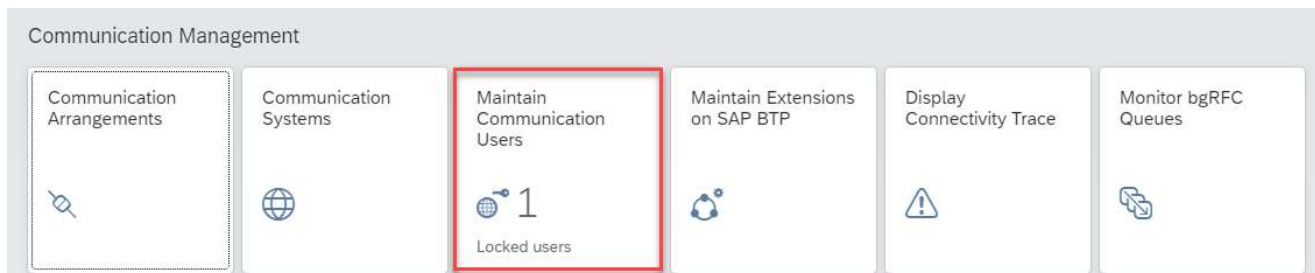

You must create a business role by using the template SAP_BR_ADMINISTRATOR, and assign this to the administrator in the SAP S/4HANA system. For more information, refer to Maintain Business Roles. <https://uacp.hana.ondemand.com/http.svc/rc/PRODUCTION/1a93686c176845f0832a2a73221dd90b/1611%20500/en-US/frameset.htm?8980ad05330b4585ab96a8e09cef4688.html>

3.7.2. Communication User

The communication user defined in the SAP S/4HANA system is used for inbound communication and for processing messages in the system.

Procedure

1. Access the SAP S/4HANA system and log on as an Administrator.
2. Choose the Maintain Communication Users tile under Communication Management.

3. Choose New.

< **SAP** Create Communication User 🔍 ? 📢

Subject	Issuer
No data	

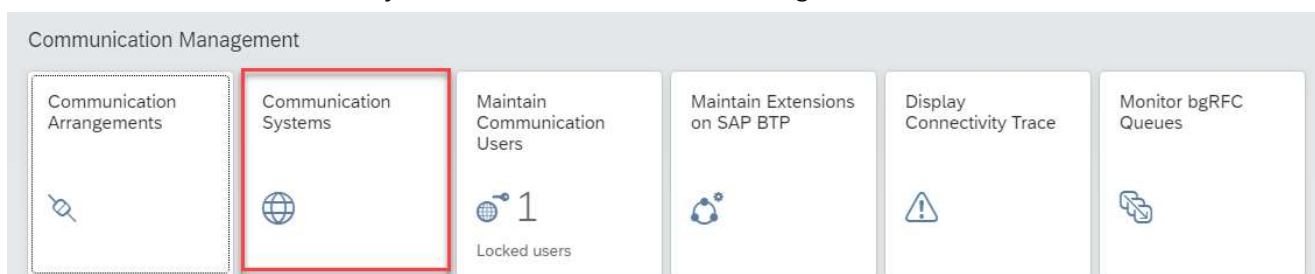

4. Enter the User Name and Description.
5. Enter a password. You can also upload an SSL client certificate.
6. Choose Create.

3.7.3. Communication System

The communication system defined in the SAP S/4HANA system is used as the source or target system.

Procedure

1. Access the SAP S/4HANA system and log on as an Administrator.
2. Choose Communication Systems tile under Communication Management.

3. In the next window, choose New. The following screen appears.

4. Enter the System ID. Optionally, you can enter the ID to recognize the integration system, which is connected with the SAP S/4HANA system.
5. Enter a descriptive name in the System Name field.
6. Choose Create.

The screenshot displays the configuration page for a communication system named 'DEMO'. The 'General' tab is active, showing fields for 'System ID' (DEMO), 'System Name' (DEMO), and 'Notes'. Below, the 'Technical Data' section includes fields for 'Host Name', 'UI Host Name', 'Business System', 'Logical System', and 'Port' (443). There are also checkboxes for 'Is Hub System' and 'Inbound Only'.
